

### Python Task :

1. Define 3 functions :
  - a. a function which takes a "name" parameter and returns "Hello" + name
  - b. a function which takes 3 parameters and returns the sum of 3 numbers
  - c. a function which prepares an iterable for a csv file
    - i. column separator and row separator should be mandatory parameters
    - ii. column separator and row separator parameters have to be given with their names, when function is called
2. log every function to a file (same file can be used)
3. log every function to a database table (same file can be used)

Note : Providing the code is enough for the solution. For the task 3, database file/dump/backup does not need to be delivered.

Enjoy :)
